

RATTLEWEDGE

Conyfair Rattlewedge

The Rattlewedge is a patented tool developed by arborists, for arborists in order to improve the security and working conditions when felling and dismantling trees. Before, the tree-specialist had to force himself into difficult and dangerous positions or rely on the help from colleagues on the ground to make fall large pieces of trunk in the right direction.

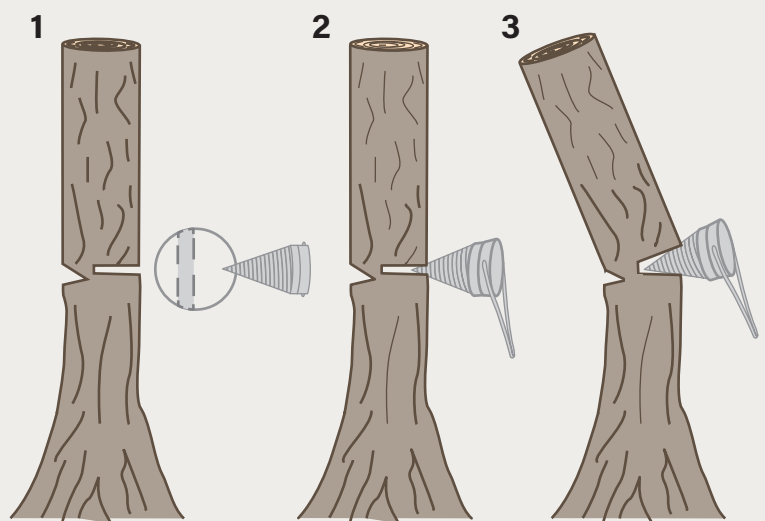

With the Rattlewedge, the arborist controls large pieces of wood without any effort. To see is to believe! The Rattlewedge, made out of light weight aluminium, hardly weighs 1,4 kg and can be taken into the tree easily. Undoubtedly, the Rattlewedge will be a standard device in any professional arborists toolbox!

Art. no.: KSIRW0000

How to use

- 1** At first, make the felling notch. Make the felling cut next. Keep a strong hinge, parallel to the felling cut.
- 2** Put the Rattlewedge perpendicular to the hinge and screw the Rattlewedge in the wood.
- 3** Once the Rattlewedge grips the wood firmly, rattle with one hand and guide the Rattlewedge in the right direction.
